

**Amendment to the Abstract:**

Please replace the Abstract as originally filed with the following new Abstract:

In a method of access and handling service lists set up from television and radio channels, DVD libraries, web sites, user services available to a digital television decoder provided with a remote control unit, a service list changing function is activated by a button of the remote control unit to go to a subsequent list in respect to a currently active list by fetching from a decoder storage an identifier of a service being recently viewed or an identifier of a first service of the subsequent list when no service being recently viewed is determined in the subsequent list. Then, the digital television decoder is set to receive the service being recently viewed or the first service. Next, on a screen is displayed the service being recently viewed or the first service together with information about a list assignment and viewing rating of a service being displayed and moving to a service list containing the service being displayed takes place. Alternatively, a service choosing function is activated for selecting a new service from the service list containing the service being displayed.
